1 General

With the rapid development of data centers, the energy consumption of data centers has become more and more prominent. Energy management and power supply and distribution design of data centers have become hot issues. An efficient and reliable data center power distribution system solution is to improve data centers. Electric energy use efficiency, an effective way to reduce equipment energy consumption. To achieve energy saving in the data center, it is first necessary to monitor each electrical load, and there are many load loops in the data center. Traditional measuring instruments cannot meet the requirements of cost, volume, installation, construction and other aspects. Therefore, it is necessary to adopt suitable data Multi-loop monitoring device required by central centralized monitoring

Acrel AMC100 series AC precision power distribution monitoring device is a measuring device designed specifically for power management of data center servers. The device is compact in design and can monitor the full electrical parameters, input and output switches and the status of the lightning arrester of A+B two incoming lines and 192 outgoing lines in real time. The alarm thresholds of all measurement channels can be set individually, and the outgoing line The limited event immediately triggers the system's sound and light alarms, and the high integration of the monitoring loop is realized in the volume of the traditional instrument.

2 Product Model

Model	Function Description
AMC100-ZA	Monitoring the full power parameters of the A+B dual three-phase AC incoming circuit, 8 switching status inputs, 4 switching status outputs, 2 leakage monitoring, 1 temperature and humidity detection, 3 RS485 communications
AMC100-FAK30	Monitor the full power parameters and switch status of a total of 30 branches of A+B dual AC outlets, and 1 RS485 communication
AMC100-FAK48	Monitor the full power parameters and switch status of a total of 48 branches of A+B dual AC outlets, and 1 RS485 communication
AMC100-FA30	Monitor the full power parameters of a total of 30 branches of A+B dual AC outlets, and 1 RS485 communication
AMC100-FA48	Monitor the full power parameters of a total of 48 branches of A+B dual AC outlets, and 1 RS485 communication
AMC100-KA30	Wet contact, monitor the switching status of 30 branches A+B, 1 RS485 communication
AMC100-KA48	Wet contact, monitor the switching status of 48 branches A+B, 1 RS485 communication
AMC100-KD30	Dry contact, monitor the switching status of 30 branches A+B, 1 RS485 communication
AMC100-KD48	Dry contact, monitor the switching status of 48 branches A+B, 1 RS485 communication
AMC100-FT30	1 way RS485 communication, 30 way temperature measurement
AMC100-FT48	1 way RS485 communication, 48 way temperature measurement

3 Technical Parameters

AC incoming line

Instrument model		AMC100-ZA
Measurement parameters		Voltage, current, frequency, active power, reactive power, power factor, active energy, reactive energy, Zero-to-ground voltage, leakage current and zero sequence current, total harmonic content (THD), 2-63 harmonics, current and voltage unbalance, ambient temperature and humidity
Bus voltage	Rated	220VAC
	Measuring range	±20%
	Overload	Instantaneous voltage 2 times/sec
Current incoming circuit	Rated	Secondary 5A
	Range	0～6A
	Overload	Continuous 1.2 times, instantaneous 10 times/sec
Temperature and humidity	Temperature Range	-40℃～+99℃
	Humidity Range	20%～90%

Input frequency		AC45～65Hz
Measurement accuracy	Incoming line	Voltage/current level 0.2, active power/energy level 0.5, reactive power/energy level 1
	Temperature	±1℃
	Humidity	±5%
Auxiliary power		AMC100-ZA: signal to take power (≤15W) AMC100-ZA-P220: 220V independent power supply AMC100-ZA-P24: 24V independent power supply
Environment	Temperature	Work: -20℃～150℃ Storage: -25℃～70℃
	Humidity	Relative humidity≤93%
	elevation	≤2500m
Switch output		4 channels 3A 250VAC/3A 30VDC
Switch input		8 dry nodes
Communication		1 isolated RS485/Modbus-RTU to the background system 1 RS485/Modbus-RTU to touch screen 1 RS485/Modbus-RTU connection downstream module Optional 1-channel Ethernet communication function
Installation Method		DIN35mm rail or bottom plate installation
Protection level		IP20
Pollution level		2
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ
	Withstand voltage	A voltage and current signal//B voltage and current signal//switch output//isolated communication port//between other ports meet AC2kV 1min, switch input and other ports should meet AC0.5kV 1min, leakage current Should be less than 2mA, no breakdown or flashover phenomenon.
Electromagnetic compatibility	Anti-static interference	Level 4
	Anti-electric fast transient burst	Level 3
	Anti-surge interference	Level 4
	Resistance to radio frequency electromagnetic field radiation	Level 3

AC outlet

Instrument model		AMC100-FA30	AMC100-FA48
Measurement parameters		Voltage, current, frequency, active power, reactive power, power factor, active energy, reactive energy, 2-31 times total current harmonic content	
Bus voltage	Rated	220VAC	
	Measuring range	±20%	
	Overload	Instantaneous voltage 2 times/sec	
Current outlet loop	Rated	50mA	
	Range	0.125～60mA	
	Overload	Continuous 1.2 times, instantaneous 10 times/sec	
Input frequency		AC45～65Hz	
Measure	Outlet	Voltage/current/active power/active energy level 0.5, reactive power/reactive energy level 1	
Auxiliary power		Powered by AMC100-ZA; DC 12-24V when used alone	
Environment	Temperature	Work: -15℃～55℃ Storage: -25℃～70℃	
	Humidity	Relative humidity≤93%	
	elevation	≤2500m	

Communication		RS485/Modbus-RTU
Installation Method		DIN35mm rail or bottom plate installation
Protection level		IP20
Pollution level		2
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ
	Withstand voltage	The voltage and current signals of circuit A//the voltage and current signals of circuit B//other ports meet AC2kV for 1min, the leakage current should be less than 2mA, and there is no breakdown or flashover.
Electromagnetic compatibility	Anti-static interference	Level 4
	Resistance to radio frequency electromagnetic field radiation	Level 3

Note: The rated input current of the secondary side of the AC outlet module is 50mA, and the default value of the primary side current is 50A. If the current transformer is different, the customer can set the transformation ratio through the touch screen or the host computer according to the actual use.

Instrument model		AMC100-FAK30	AMC100-FAK48
Measurement parameters		Voltage, current, frequency, active power, reactive power, power factor, active energy, reactive energy, 2-31 times total current harmonic content	
Bus voltage	Rated	220VAC	
	Measuring range	±20%	
	Overload	Instantaneous voltage 2 times/sec	
Current outlet loop	Rated	50mA	
	Range	0.125～60mA	
	Overload	Continuous 1.2 times, instantaneous 10 times/sec	
Input frequency		AC45～65Hz	
Measure	Outlet	Voltage/current/active power/active energy level 0.5, reactive power/reactive energy level 1	
Auxiliary power		Powered by AMC100-ZA; DC 12-24V when used alone	
Environment	Temperature	Work: -15℃～55℃ Storage: -25℃～70℃	
	Humidity	Relative humidity≤93%	
	elevation	≤2500m	
Communication		RS485/Modbus-RTU	
Installation Method		DIN35mm rail or bottom plate installation	
Protection level		IP20	
Pollution level		2	
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ	
	Withstand voltage	The voltage and current signals of circuit A//the voltage and current signals of circuit B//other ports meet AC2kV for 1min, the leakage current should be less than 2mA, and there is no breakdown or flashover.	
Electromagnetic compatibility	Anti-static interference	Level 4	
	Resistance to radio frequency electromagnetic field radiation	Level 3	

Note: The rated input current of the secondary side of the AMC100-FAK module is 50mA, and the default value of the primary side current is 50A. If the current transformer is different, the customer can set the transformation ratio through the touch screen or the host computer according to the actual use.

Active switch module

Instrument model		AMC100-KA30	AMC100-KA48
Input frequency		45-65Hz AC45-65Hz	
Auxiliary power		Powered by AMC100-ZA, DC 12-24V when used alone	
Environment	Temperature	Work: -15℃～55℃ Storage: -25℃～70℃	
	Humidity	Relative humidity≤93%	
	elevation	≤2500m	
Switch input		30 wet nodes (AC 220V)	48 wet nodes (AC 220V)
Communication		RS485/Modbus-RTU	
Installation Method		DIN35mm rail or bottom plate installation	
Protection level		IP20	
Pollution level		2	
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ	
	Withstand voltage	A switch value input signal//B switch value input signal//other ports meet AC2kV 1min between two, the leakage current should be less than 2mA, no breakdown or flashover phenomenon.	
Electromagnetic compatibility	Anti-static interference	Level 4	
	Resistance to radio frequency electromagnetic field radiation	Level 3	

Passive switch module

Instrument model		AMC100-KD30	AMC100-KD48
Auxiliary power		Powered by AMC100-ZA, DC 12-24V when used alone	
Environment	Temperature	Work: -15℃～55℃ Storage: -25℃～70℃	
	Humidity	Relative humidity≤93%	
	elevation	≤2500m	
Switch input		30-way trunk node	48-way trunk node
Communication		RS485/Modbus-RTU	
Installation Method		DIN35mm rail or bottom plate installation	
Protection level		IP20	
Pollution level		2	
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ	
	Withstand voltage	A switch value input signal//B switch value input signal//other ports meet AC2kV 1min between two, the leakage current should be less than 2mA, no breakdown or flashover phenomenon.	
Electromagnetic compatibility	Anti-static interference	Level 4	
	Resistance to radio frequency electromagnetic field radiation	Level 3	

Temperature measurement module

Instrument model		AMC100-FT30	AMC100-FT48
Number of measuring channels		30 channels	48 channels
Measurement accuracy		Temperature ±1℃	
Auxiliary power		Powered by AMC100-ZA, DC 12-24V when used alone	
Function	Temperature Range	-20℃～150℃	
	Communication	RS485/Modbus-RTU	
Installation Method		DIN35mm rail or bottom plate installation	
Protection level		IP20	
Pollution level		2	
Environment	Temperature/humidity/elevation	Working temperature: -20℃～60℃ Storage temperature: -25℃～70℃ Relative humidity: ≤93% Altitude: ≤2500m	
Security	Insulation	The insulation resistance between all terminals and the conductive parts of the shell is not less than 100MΩ	
	Withstand voltage	AC2kV 1min between auxiliary power supply and temperature measurement, leakage current should be less than 2mA, no breakdown or flashover phenomenon	
Electromagnetic compatibility	Anti-static interference	Level 4	
	Resistance to radio frequency electromagnetic field radiation	Level 3

6 Protocol

This agreement specifies the physical connection and communication protocol for data exchange between the AMC100 series AC precision power distribution monitoring device and the data terminal equipment. The protocol is similar to the Modbus_RTU communication protocol.

6.1 Brief description of the agreement

The communication protocol used by the AMC100 series AC device defines the data sequence definition of address code, function code, and check code in detail, which are all necessary content for specific data exchange. This protocol uses a master-slave response connection (half-duplex) on a communication line, which means that the signal is transmitted in two opposite directions on a single communication line. First, the signal from the host computer is addressed to a unique terminal device (slave), and then the response signal from the terminal device is transmitted to the host in the opposite direction.

This protocol only allows communication between the host (PC, PLC, etc.) and terminal equipment, and does not allow data exchange between independent terminal equipment, so that each terminal equipment will not occupy the communication line when they are initialized, but only in response Inquiry signal to the machine.

6.2 Transfer Method

The information transmission is asynchronous, and the unit is byte. The communication information transmitted between the master and the slave is an 11-bit word format, including 1 start bit, 8 data bits (the least effective bit is sent first), Parity check bit (no parity), 2 stop bits.

6.2.1 Data frame format

Address code	Function code	Data area	CRC verification code
1 byte	1 byte	n bytes	2 bytes

6.2.2 Address domain

The address field is at the beginning of the frame and consists of one byte (8-bit binary code), and the decimal system is 0～255. In our system, only 1～247. Other addresses are reserved. These bits indicate the address of the terminal device designated by the user, which will receive data from the host connected to it. The address of each terminal device must be unique, and only the addressed terminal will respond to the query containing the address. When the terminal sends back a response, the slave address data in the response tells the host which terminal is communicating with it.

6.2.3 Functional domain

The function field code tells which function is performed by the addressed terminal. The following table lists the function codes used in this series of devices, as well as their meanings and functions.

Code	meaning	behavior
03	Read data	register to get the current binary value of one or more registers
16	Preset multiple registers	Set the binary value to a series of multiple registers

6.2.4 Data field

The data field contains the data required by the terminal to perform a specific function or the data collected when the terminal responds to a query. The content of these data may be numerical values, reference addresses or setting values. For example, the function domain code tells the terminal to read a register, and the data domain needs to specify which register to start and how many data to read. The embedded address and data vary according to the type and the content of the slave.

6.2.5 Error check field

This field allows the host and terminal to check for errors during transmission. Sometimes, due to electrical noise and other interference, a set of data may have some changes on the line when it is transmitted from one device to another. Error checking can ensure that the host or terminal does not respond to the data that has changed during the transmission. This improves the safety and efficiency of the system, and the error check uses a 16-bit cyclic redundancy method (CRC16).

6.2.6 Methods of error detection

The error check field occupies two bytes and contains a 16-bit binary value. The CRC value is calculated by the transmitting device and then appended to the data frame. The receiving device recalculates the CRC value when receiving the data, and then compares it with the value in the received CRC field. If the two values are not equal, it will happen. mistake.

During CRC operation, first preset a 16-bit register to all 1s, and then continuously calculate the 8 bits in each byte in the data frame with the current value of the register, only 8 data per byte Bit participates in generating CRC, start bit, stop bit and possible parity bit do not affect CRC. When generating the CRC, the 8 bits of each byte are

XORed with the contents of the register, and then the result is shifted to the low bit, and the high bit is supplemented with "0", and the least significant bit (LSB) is shifted out and checked. If it is 1, This register will perform an exclusive OR operation with a preset fixed value (0A001H). If the lowest bit is 0, no processing will be performed.

The above processing is repeated until 8 shift operations are performed. After the last bit (the 8th bit) is shifted, the next 8-bit byte is XORed with the current value of the register, and the other 8 above is also performed. When all the bytes in the data frame are processed, the final value generated is the CRC value.

The process of generating a CRC is:

(1)Preset a 16-bit register as 0FFFFH (all 1s), which is called CRC register. . XOR the 8 bits of the first byte in the data frame with the low byte in the CRC register, and store the result back to the CRC register. Shift the CRC register one bit to the right, fill the highest bit with 0, and shift the lowest bit out and check. If the lowest bit is 0: repeat the third step (the next shift); if the lowest bit is 1: change the CRC register to a preset fixed value (0A001H) Perform exclusive OR operation.

Repeat the third and fourth steps until 8 shifts. A complete eight bits have been processed in this way.

(2)Repeat steps 2 to 5 to process the next eight bits until all bytes are processed. The final CRC register value is the CRC value.

In addition, there is a method to calculate CRC using a preset table. Its main feature is fast calculation speed, but the table requires a larger storage space. This method will not be repeated here, please refer to the relevant information.

6.3 Introduction to Function Code

6.3.1 Function code 03H: read register

This function allows users to obtain the data and system parameters collected and recorded by the device. The number of data requested by the host at one time is not limited, but it cannot exceed the defined address range.

The following example is reading 3 basic data collected from slave 01 (each address in the data frame occupies 2 bytes) Uab, Ubc, Uca, where the address of Uab is 03H, the address of Ubc is 04H, Uca The address is 05H.

Host send		Send message
address code		01H
function code		03H
Starting Address	high byte	00H
	Low byte	03H
register Quantity	high byte	00H
	Low byte	03H
CRC check code	Low byte	F5H
	High byte	CBH

Return from the machine		Return information
address code		01H
function code		03H
Number of bytes		06H
Register data	high byte	0EH
	Low byte	EEH
Register data	high byte	0EH
	Low byte	E8H
Register data	high byte	0EH
	Low byte	E9H
CRC check code	Low byte	8FH
	High byte	7EH

6.3.2 Function code 10H: write multiple registers

Function code 10H allows users to change the contents of multiple registers. The system parameters and switch output status of the instrument can be written with this function number. The host can write up to 16 (32 bytes) data at a time.

The following example is that the instrument with the preset address 01 outputs the switch value DO at the same time. The switch output status indication register address is 0045H, and the first bit corresponds to DO.

Host send		Send message
address code		01H
function code		10H
Starting Address	high byte	00H
	Low byte	45H
register Quantity	high byte	00H
	Low byte	01H
Number of bytes		02H
0045H Data to be written	high byte	00H
	Low byte	01H
CRC Check code	Low byte	69H
	High byte	05H

Return from the machine		Return information
address code		01H
function code		10H
Starting Address	high byte	00H
	Low byte	45H

Alarm status data read （0x03F0～0x0420） **When the module is FAK30/FA30,the effective alarm data are 1-15 and 25-39 channels of data,When the address is set to 20-29, the effective alarm data is 1-30 channels.When the module is FA48(30),the status bit of switching value is always 0 and no acquisition is required.**

Alarm status assignment

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
			Switch	Over-current secondary alarm	Over-current level 1 alarm	Low current level 1 alarm	Under current secondary alarm

Number	Address	variable	Remark	Length(Bite)	Unit

7 Precautions

7.1 The device should be installed in a dry, clean place away from heat sources and strong electromagnetic fields.

7.2 Pay attention to the phase sequence and polarity of AC voltage and current when wiring the device, otherwise the measurement will be inaccurate.

7.3 CT must be used for current input, and the transformation ratio parameter of incoming line CT must be set through communication.

7.4 The accuracy of CT affects the measurement accuracy of this device. The angle difference of CT will affect the measurement accuracy of the power and electric energy of the device.

7.5 When applied to direct access system without PT, a 2A fuse should be installed.

7.6 The CT grounding terminal of the current input on the device should be led to the grounding terminal separately. It is not allowed to connect the current input grounding terminal in parallel on the device and then lead to the grounding terminal.

7.7 The communication cable should use shielded twisted pair.

8 Common fault diagnosis and troubleshooting methods

8.1 The measurement of the device is inaccurate

*Check whether the wiring of voltage and current is correct, and whether the incoming and outgoing wires of current input are correct;

*Check whether the CT setting of the device corresponds to the actual external CT;

8.2 The voltage and current measurement is correct but the power measurement is inaccurate

*Check whether the current input direction is correct;

*Check whether the phase corresponding to each current loop is correct; the outgoing loop needs to be adjusted according to the actual connection;

8.3 Abnormal communication

*Check whether the communication cable is connected properly;

*Check whether the A and B terminals of communication are staggered;

*Check whether the address of the device is set correctly, and whether the communication baud rate is set correctly;

*When the communication of multiple devices is abnormal, first try to see if the communication of the single device is normal;

8.4 The incoming line voltage, current, and power are all, but the electric energy has no value

*Check the CT ratio setting of the incoming line.
