Warning. User must set protective functions and parameters in accordance with conditions of your motor before using the protector.

1.Overview

ARD3 series intelligent motor protectors (hereinafter referred to as the protector), adopt the latest single-chip microcomputer technology which has many features like strong anti-interference capability, stable and reliable performance, digital, intelligent and networked, etc. Protector can protect motors from many faults during the motor running such as starting timeout, overload, locked rotor/block, phase failure, unbalance, under load, grounding, earth leakage, over voltage, under voltage, phase sequence, overpower, under power, temperature, external faults, etc. and is equipped with SOE fault event log function which is convenient for maintenance stuff to find the causes of the problems, and display the running state clearly and intuitively through LCD in Chinese in four lines, status indicators and other ways. It is suitable for coal mine, petrochemical, metallurgy, electric power, shipbuilding, civil construction and other fields. The protector has RS485 remote communication interface and DC4-20mA analog output, which is convenient to form a network system together with control machines like PLC and PC to realize the remote control of motor running.

2.Product type

Table 1 Rated current

| Rated current for protector | CT tansformer ratio | Turns of Transformer(Primary) | Rated power of motor (kW) | Range of setting current (A) |
|-----------------------------|---------------------------|----------------------------------|---------------------------|---------------------------------|

Table 4 Additional function

Note:

1. The protecter provides more than one Additional function, and provides only one Rated current and one starting control, for example, a motor rated current is 45A, Manual mode control the starting, and the protecter need Communication function, Residual current protection, Temperature protection and Display mode, so the ARD3 protecter type is ARD3-100T/LTC-90L.

2.Residual current includes grounding current and leakage current,only one can be chosen.The grounding current is the superposition of three phase current vector sum,and leakage current can be detected by zero sequence tranformer.Leakage current signal rang should be marked when ordering for easy production setting.

3.4-20mA analog output factory default is 2 times the rated current value, that is to say 2 times the rated current value correspond to 20mA,0 to 4mA. The customer can choose corresponding analog electrical parameters, such as phase A current, phase B current, phase C current, line AB voltage, line BC voltage, line AC voltage, active power and so on.DC 4mA is corresponding to the minimum of seleted variable, DC 20mA is corresponding to the maximum of seleted variable. Mark the specific requirements before ordering, otherwise set in default.

4.Overload protection is tE time protection or inverse-time overload protection, inverse-time overload protection in default, mark in the order if tE time protection is needed, otherwise set in default.

5.Motor protector can be used with current transformer and residual current transformer which consistent with the same product number.

6. Modbus-RTU(C) and Profibus-DPV0(CP)only one can be chosen.

3 General technical index

Technology specifications are as shown in table 6.

Table 6 Technology specifications

| Technical parameters | Technical index |
|---|---|
| Auxiliary power supply of the protector | AC 85V~220V ,DC I00V~350V, power dissipation 15VA |
| Motor rated operating voltage | AC 220V/380V/AC660V, 50Hz/60Hz |

| | 1A(0.IA-9999A) | | | |

5 Display and parameter setting

5.1 Operation Panel Instruction

Users can observe the running status of motor through the LED indicating lamp and LCD on display unit and start, stop, reset and set parameters through the buttons.

Figure 9 panel board of display module

| Table 7 | operation | instruction |
|---------|-----------|-------------|
|---------|-----------|-------------|

| No. | Name | Status | Function Description | | |
|-----|-----------------|-----------|--|--|--|
| 1 | Ready LED | 0.7 | This indicator is on, meaning the protector is in normal state and | | |
| 1 | indicating lamp | On | the motor can be started. | | |
| 2 | Start 1 LED | Or | This indicating lamp is on, meaning the protector starting 1 relay | | |
| 2 | indicating lamp | On | closed | | |
| 2 | Start 2 LED | 0.7 | This indicating lamp is on, meaning the protector starting 2 relay | | |
| 3 | indicating lamp | On | closed | | |
| 4 | Stop LED | Or | This is directing laws is an examine the motor is in staming status | | |
| 4 | indicating lamp | On | This indicating lamp is on, meaning the motor is in stopping status. | | |
| 5 | Start LED | Or | This indicating laws is an examine the motor is in starting status | | |
| 5 | indicating lamp | On | This indicating lamp is on, meaning the motor is in starting status. | | |
| | Run LED | 0.7 | This is directing to see the second state in more in second | | |
| 0 | indicating Lamp | On | I his indicating lamp is on, meaning the motor is in running stati | | |
| 7 | Alarm LED | Or | This indicating lamp is on, meaning the protector alarm relay has | | |
| / | indicating lamp | On | taken action. | | |
| 0 | Trip LED | 0.7 | This indicating lamp is on, meaning the protector Trip relay has | | |
| 8 | indicating lamp | On | taken action. | | |
| 9 | Stop button | Hold down | Trip starting 1, starting 2 relays | | |
| 10 | Start 1 button | Hold down | Operate starting 1 relay to make it closed | | |
| 11 | Start 2 button | Hold down | Operate starting 2 relay to make it closed | | |
| 12 | Confirm button | Hold down | Enter the menu and modify the parameters | | |
| 13 | arrow key | Hold down | Turn on the menu; data transfer; view event log | | |
| 14 | D arrow key | Hold down | Turn down menu; modify data; | | |
| 15 | cancel button | Hold down | Exit the menu; cancel operation; lighten backlight | | |
| 16 | rst button | Hold down | Reset the protector | | |
| 17 | LCD display | | | | |
| 17 | screen | | Display various measured parameters and setting parameters | | |

5.2 Parameter setting

5.2.1 Display menu contents

1. A, B, C three-phase current and imbalance percentage

2. Three-phase current and the percentage of three-phase average current to the set rated current

3. Uab, Ubc, Uca line voltage

4. Active power P, apparent power S, power factor PF;

5. lav three-phase average current, Uav three-phase average voltage, ld earth leakage current, frequency F;

6. Heat capacity percentage;

7.Thermal resistance value;

8.Route 5 relay input: 1-Starting 1, 2-Starting, 2, 3-Alarm (programmable) ,4-Trip (Programmable), 5-Trip 9. Route 9 DI status.

Users can press the "^D" button on the display unit to display the selection of menu interface.

If users want to enter parameter setup menu, they can press the "Confirm" button when displaying the menu interface and then password input interface comes out, and users can enter the parameter setup menu after inputting the password (initial password is 0001, universal password is 0008), and users can press "O" and "O" button to input the correct password and then press "Confirm" button to enter parameter setup menu; and at this moment users can press "O" and "O" buttons to select the needed items and then press "Confirm" button to enter the setting

interface and again press "^(C)" and "^(C)" buttons to select the needed sub-items, press "Confirm" key to enter the value setting interface, and then press "^(C)" and "^(C)" to set the value, after finishing setting, press "Confirm" key for save, after that, press "Cancel" button to exit or press "Cancel" button to exit without saving.

Note:

High byte ahead, low byte behind, such as [0][1], [0]is high 8-bit, and [1] is low 8-bit, other analogy. Output parameter 1 character DP master station-ARD).

This can be displayed specifically as follows:

| Output | Parameters | Value range | Remarks |
|----------|-----------------|----------------------------------|--|
| | | Bit0: stopping | |
| | Control Word | Bit1: starting 1 | 0. alogad |
| | | Bit2: starting 2 | 1: breakover |
| | | Bit3:remote resetting | |
| [00][01] | | Bit4: relay 3 | |
| | | Bit15: output data enable bit | When this bit is 1, all operations of Bit0-Bit4 are valid, When it is 0, operations are invalid. |

Profibus output data (control data), for example, if motor is remotely started, starting mode is selected as "Starting 1", and output data: Ox8002 (hexadecimal number).

8 Typical application solutions

ARD3 motor protector protected mode wiring diagram

Protected mode: the starting or stopping of motor is controlled by external button, the magnetizing coil of contactor KM connects with the normally closed contact of the Trip relay using series connection. Close QA, press starting button SF, the magnetizing coil of KM is energized and close the main contactor, then the motor starts; when press

stopping button SS, the magnetizing coil of KM is loss of power and Trips the main contact, the motor stops. Notes:

1. Trip (DO4 programmable) relay can be used for output to realize the quick-break function of moulded case circuit breaker.

2. Programmable relay can be defined as starting 1, starting 2, alarm fault output, Trip fault output, device self-checking output, device power output, stopping status ready, running status output, DI controlling output, bus control.

ARD3 motor protector direct starting mode wiring diagram

Direct starting :the starting or stopping of motor is controlled by protector, the magnetizing coil of contactor KM connects with the normally closed contact of the Trip relay and normally open contact of starting 1 relay using series connection, close QA, press "Starting I"button on the display unit (staring control is set to manual mode, enable On-site control) to close the main contactor of KM, then the motor starts; when pressing "stopping" button, the magnetizing coil of KM is loss of power and Trips the main contactor, the motor stops.

Control authority selection (except protection mode): 90FL display unit button On-site control, DI terminal on-site control, PC communication remote control. DI6 and DI7 are combined to achieve three-position authority selection. In the table below, "0" means the control authority is not connected,

"1" means connected.

| On off input | DI input status | | | |
|-----------------|-------------------------|-------------------------|--|--|
| On-on input | DI1 control authority 1 | DI2 control authority 2 | | |
| On-site control | 1 | 0 | | |
| Remote control | 0 | 0 | | |
| On-sit control | 0 | 1 | | |

Table 10 DI control authority definition

ARD3 motor protector Y- Δ starting mode wiring diagram

Y- Δ starting: motor starting and stopping are controlled by the protector. "According to the method illustrated, after the control circuit is connected, and then close QA, press the "start I" " button on display unit, (starting control is set to start in two steps to enable On-site control), enable the starter relay 1 to close, KML KM3 attract coil to energize, and main contactor of KML KM3 to close. The motor is started by Y way, when reaches conversion time, the protector will automatically disconnect starter relay 1, while close the starter relay 2. KM2, KM3 attract coil is energized, and close main contactor of KM2, KM3; the protector turns into A running, press the "" stop "" button, and the motor will stop working."

9 settings and instructions of protection function

Starting overtime protection

While the motor starting time reaches, and the motor round current detected by protection still more than

110% Ie, the protection will start.Refers to increased safety motor, the starting time do not set more than tr 1.7 times. Overload Protection

When the motor is running in the situation of overload, its current is over rated for a long time. The motor will overheat and burn down, as the insulation property decreased. The protection computes the heat capacity of motor according to the heart generation characteristics of motor, simulates heat generation characteristics of motor to protect the motor.

Overload protection current-time comparison show in table 10, overload characteristic curves (K curves) show in picture 11.

| Optional tripping curves level K | 5 | 10 | 15 | 20 | 25 | 30 | 35 | 40 | | |

Figure 11 overload characteristic curves graph

Under load Protection

When the load carried by motor is the pump-load, no load or underload will damage the motor, the protection provides underload protection. When the ratio of the average 3 phase current and rated current is lower than set value, the protection should trip or alarm in tripping(delay) set time.

Phase failure protection or imbalance protection

Running in the condition of phrase failure or 3 phase current unbalance make great harm to motor, when phase failure occurs or 3 phase current unbalance, the imbalance ratio reaches the protective set value, the protection will send a alarm or tripping signal in accordance with internal set to make the motor safely.

t_E time protection (suitable for safety-increased motor)

After the AC winding reaches the rated operation stable temperature at maximum ambient temperature for safety-increased motors, the desired time from the beginning of locked-rotor current to the time rising to limiting temperature is tE. The tE time of safety-increased motors is usually provided by the motor manufacturers, and users can find the data on the motor nameplate.

When providing locked-rotor and within the tE time, disconnect the thermal overload protection of electric motor, only after the motor starting is completed, the independent delay timer can be applied.

Delay timer with independence.tE protection characteristic curve action delay table shown in Table 22, and curve diagram as shown below.

t_E protection delay and locked-rotor current ratio IAII.'s current-time characteristic curve

t_{Ep}: Allow locked-rotor time when under 7 times rated current; IA: locked-rotor current; Ie: rated current of motor.

| Table 14 Action Delay Characteristics Table | | | | | | | | | |

Note:

(a) t_E protection time = operation time 12xtEp setting when Ep is 2 (S)

(b)when tE is set to 5 (S), tE value by starting current ratio IAI Ie is determined according to IEC79-7,

GB3836.3-2000 standard, when apply to safety-increased motor tE protection, its inverse time overload may refer to characteristic curve settings. To ensure that the power is turned off before the time when the motor companying rotating, the inverse time curve of overload protection should be down about 15%.

(c)The action time of "tE protection is achieved by setting ""Motor Type"" and "" Trip class"" according to Table 9 ". t_{Ep} (Trip class) selects the appropriate Trip curves. "(When the motor type is selected to ""safety-increased motors", the "Trip class will automatically become tEp setting: Otherwise, the Trip curve is inverse time overload Trip curve of normal motor."

■ phase sequence protection

When the protector detects the error of voltage phase sequence of the motor, the locking motor will start to protect the motor safety.

Grounding/ Earth leakage Protection

ARD3 has the function of grounding and leakage protection, but user can only choose one kind. Grounding protection calculate residual current automatically, do not need external transformer, used for short-circuit protection about motor metal case. By increasing the leakage transformer, leakage protection detected 30mA-900mA fault current values, mainly used for indirect grounding protection to ensure personal safety.

Over voltage protection

Too high voltage will result in extent damage of motor insulation, and when the operating voltage of motor exceeds the protection voltage, the protector will protect according to the set requirements, and Trip within the Trip (delay) setting time.

Under voltage protection

Too low voltage will cause the motor speed to reduce, or even stop, when the operating voltage of motor drops to the under voltage protection set, the protector will protect according to the set requirements, and Trip within the Trip (delay) setting time.

Locked-rotor protection (starting over current protection)

During the process of motor starting, because of the load is too large or their own mechanical reasons, motor shaft may be stuck. Without the timely lifting of failure, the motor will overheat and burn down because of decreasing insulation property. When the current reaches the current operation set, protection trips in tripping(delay) set timely and avoids burning motor.

Blocking protection

Blocking protection used for motor shaft stuck during the process of motor running. When the current reaches the current operation set, protection trips in tripping(delay)set timely and avoids burning motor.

Over power protection

When the percentage of load power and rated power is higher than the preset action value, the protector will act or alarm within the action time set.

Under power protection

When the percentage of load power and rated power is lower than the preset action value, the protector will act or alarm within the action time set.

Temperature protection

Motor temperature protection regards the thermistor values sent by thermistor detector embedded in the motor's stator windings or bearings as the protection conditions. When the protector detects that the value of the thermistor is larger than the preset protection value, the protector will Trip Within Trip(delay) set time.

External fault protection (technology interlock protection)

Control authority

Protector has a variety of control authority, and users can set different control authority to control the motor according to the actual needs.

"Full-controlled: when the users set the control authority to ""full-controlled"", then the users can press a button on the display unit to achieve On-site control."

System, PC remote control, DI termination to achieve On-site control starting and stopping of motor.

The starting and stopping of protector can only be controlled by local via using the keys on the display unit.

The starting and stopping of protector can only be controlled by on-site via DI input terminal on the protector. Remote: the starting and stopping of protector can only be controlled via remote communication of PC.

One in three by using DI end to select the control position (select one from local, on-site, and remote).

Starting control

The protector has different start control mode, and the users can select different start control way according to the actual situation.

Protection mode 2, under this mode, the protector can not be controlled by local and on-site. Manual mode: under this mode, it is need to manually control 2 starter relay separately.

Two-step mode, under this mode, only need to adopt manual operation for start 1, after the set delay time, start 1 will automatically disconnect and simultaneously start 2 action. If the self-start function is opened up, when the protector is power on, it will start 1 and start 2 relays in automatic sequence of actions.

"Two-speed mode: under this mode, ""start I"" is low-speed operation, and ""start 2"" is high-speed operation." self-start. During power up or power restoration process, the protector will start the motor according to setting sharing.

"If the self-start control of system is ""open", and "self-start mode is set to ""restore"", then the protector will determine whether there is need to re-start based on the state before power off, if the system is running before power off, then it will start to run according to the set self-start delay time after power on; if the self-start mode is ""start"", then the protector can achieve motor group delay time sequence starting once power on."

Loss voltage restart

"This function is only valid when with voltage function and loss voltage restart function must be set to ""start 1"" or ""start 2"" state, while there is need to close the under voltage Trip function."

When the motor is running and zero current is detected, then begin timing under loss of pressure; within immediate time of loss voltage, if the voltage can be restored to voltage setting set under the loss of pressure starting, the starter relay is not Tripd; when after the greater immediate time of loss of pressure, the starter relay will be Tripd.

If the voltage can be restored to voltage setting set under the loss voltage restarting within the time, the protector will start the motor under delay after delay restart. When power failure time is greater than the loss voltage restarting time allowed, this eliminates relevant information, no re-start any more. Notes:

1. two-speed motor starting time, overload, under load, locked-rotor, blocking, over power, under power, short circuit in two sets, when carry out setting, there is need to select low-speed switch in system parameters firstly"; "OFF"" is the low-speed parameter setting," "ON"" is the high-speed parameter setting."

2. 4 to 20 analog output: Default 2 gal IA corresponding 2 times the rated current value. Users can also set their own required corresponding parameters and magnification of analog output (note: magnification setting is only valid for the current). See the below table:

| Transmission type | Transmission magnification |
|-------------------------------|--|
| 0. A-phase current | Ie integral multiples (1-8) |
| 1. B-phase current | Ie integral multiples (1-8) |
| 2. C-phase current | Ie integral multiples (1-8) |
| 3.mean current | Ie integral multiples (1-8) |
| 4. AB line voltage | 95-190,330-990,190-570 (50% -150% system voltage) corresponds to 4-20mA |
| 5. BC line voltage | 95-190,330-990,190-570 (50% -150% system voltage) corresponds to 4-20mA |
| 6. CA line voltage | 95-190,330-990,190-570 (50% -150% system voltage) corresponds to 4-20mA |
| 7. Average line voltage | 95-190,330-990,190-570 (50% -150% system voltage) corresponds to 4-20mA |
| 8. PTC (100-30K) | Default 100-30000 corresponds to 4-20mA |
| 9.Thermal capacity percentage | Default 0-100% corresponds to 4-2 gamma lA |
| 10. Power | Rated power integral multiple -8) |
| 11. Frequency | 30-70Hz corresponds to 4-20mA |

Table 15 Transmission setting instructions

10 Cautions

1. The Trip relay (terminal no.95, 96) is normally open, and closed after power on.

2. The protector can not display real-time ""alarm information, which can only display alarm condition when enter the query menu." Customers are advised to view when the fault alarm is stable.

3. The protector can measure 7.2 times overload current of specifications ordered in maximum, namely, 100A protector can measure 720A current in maximum.

When set the short-circuit protection, customers need to set reasonable parameters according to specifications set by the protector.

4. when the start control of protector is set to "" two-step start"", "" starting – delay" time should be less than the start time." 5. Pei-rotating protection Trip delay time should be less than the starting time, otherwise the locked-rotor protection function will not be achieved.

6. When the protector is equipped with grounding / earth leakage protection, the conducting wire of $\$ protector introduced from zero sequence current transformer is recommended to use shield wire, otherwise this may lead to inaccurate measurements.

7.Protector provides asynchronous half-duplex RS485 communication interface, adopt MODBUS-R 'four protocol,

and a variety of data can be transmitted on the communication line. Theoretically, a single line can simultaneously connect up to 128 protectors, and each protector can set their own address (Addr). Communication connection is recommended to use shielded twisted pair wire whose diameter should be not less than 0.5mm20. When wiring, make communication lines away from power cable or other strong electric field environment.

8. The rated current of protector should be proper rated operational current value of the motor; if this setting value is lower than the normal value of the motor's rated operational current, it may cause that the motor can not be started normally: higher than normal rated operation current value of motor, the protector may not carry out normal protection when the motor appears fault.

9. Once the protector occurs Trip, the protector should be reset after debugging and before re-start the motor, otherwise it will not start the motor.

10. After the thermal overload protection of motor, due to the heat accumulation, it can be reset after cooled.

11. In the actual use on-site, the unreasonable protection parameters settings may cause the motor to has protection action once the motor started or no protection action; at this time, all protection functions can be turned off, various protection parameters can be reset in accordance with various parameters obtained from normal operation of the motor.

12. if the various protection parameters set by protection are appropriate, but the protector has action once the motor started, at this time, the cause of fault can be found according to the action code displayed by protector.

13. The protector's parameters are default settings when made(unless users have special requirements); In actual use, various protection functions must be opened by users based on the actual needs, and various parameters can be set.

14. Unless otherwise specified by users, the connecting line of transformer and protector body is 1m in default, and the connecting line of protector body and display unit is 1.5m in default.

15. Special requirements should be specified in the order if users have special requirements(such as single-phase motor protector, length of connection line, etc.).

11 Order sample

Example:

Type: ARD3-25A/TCSR+90FL Auxiliary power: AC220V

Rated current of motor: $6.3A \sim 25A$ applies z three-phase motor

Measurement parameters: three-phase current, temperature resistance

Additional function : Additional functions: start control, thermal protection, alarm output, RS485 communication, 20 display methods of SOE event records: 90FL (LCD)
